

- 8** HIV-1 protease is an enzyme produced by the HIV virus.

Two identical chains of 99 amino acids form the enzyme. In each chain, amino acids 25, 26 and 27 in the sequence form part of the active site.

Which orders of protein structure control the shape of the active site?

- A** primary, secondary, tertiary and quaternary
- B** primary, secondary and tertiary only
- C** primary and quaternary only
- D** quaternary only
