

10 Cocoa butter contains three different triglycerides. These triglycerides are made from the fatty acids:

- oleic acid (O)
- palmitic acid (P)
- stearic acid (S).

The three triglycerides found in cocoa butter are POS, SOS and POP.

The chemical structure of the triglyceride POS is shown next to a diagrammatic representation of POS.

Which statement is correct?

- A** Triglyceride POP contains two unsaturated fatty acids joined by ester bonds to glycerol.
- B** Triglyceride POS contains two less carbon atoms than triglyceride POP.
- C** Triglyceride SOS contains four more carbon atoms than triglyceride POP.
- D** Triglyceride SOS contains two saturated fatty acids joined by hydrolysis to glycerol.
