

**64** An inherited condition is caused by a recessive allele.

The family tree shows the inheritance of this condition in one family.

One of the daughters in this family tree has children with a man who does not have the condition.

For the two situations described in the table, which row shows the probability that their first child will be a girl who has the condition?

(Assume no new mutations.)

|          | <i>father is<br/>homozygous dominant</i> | <i>father is<br/>heterozygous</i> |
|----------|------------------------------------------|-----------------------------------|
| <b>A</b> | 0                                        | 0                                 |
| <b>B</b> | 0                                        | 0.125                             |
| <b>C</b> | 0                                        | 0.25                              |
| <b>D</b> | 0.5                                      | 0                                 |
| <b>E</b> | 0.5                                      | 0.125                             |
| <b>F</b> | 0.5                                      | 0.25                              |
