

3(a)	all 4 atoms and the R group correct ;	1
		
3(b)(i)	0.4 (min ⁻¹) ;	1
3(b)(ii)	straight line that continues to rise across all concentrations / line does not level off at higher concentrations ;	1
3(c)(i)	<i>any three from:</i> 1 at low, catechol / substrate, concentrations there are many active sites available ; 2 adding more substrate increases the rate of, enzyme–substrate complex formation / more successful collisions / AW ; 3 at high(er) substrate concentrations all the active sites are, occupied / saturated ; 4 at low substrate concentrations the substrate is the limiting factor or at high substrate concentrations the enzyme concentration is a limiting factor or at high substrate concentrations some factor other than substrate concentration is the limiting factor ; 5 number of active sites does not change / AW ;	3
3(c)(ii)	0.21 (mol dm ⁻³) ;	1
3(c)(iii)	catechol oxidase has a higher affinity for methylcatechol than for catechol / ora ;	1
