

Question Number	Answer	Additional guidance	Mark
1(a)(i)	The only correct answer is A amyloplast <i>B is not correct because starch is not stored in the middle lamella</i> <i>C is not correct because starch is not stored in the plasmodesmata</i> <i>D is not correct because starch is not stored in the tonoplast</i>		(1)

Question Number	Answer	Additional guidance	Mark
1(a)(ii)	The only correct answer is A one <i>B is not correct because starch contains 1,4 and 1,6 glycosidic bonds, is a polymer of α-glucose and is a polysaccharide</i> <i>C is not correct because starch contains 1,4 and 1,6 glycosidic bonds, is a polymer of α-glucose and is a polysaccharide</i> <i>D is not correct because starch contains 1,4 and 1,6 glycosidic bonds, is a polymer of α-glucose and is a polysaccharide</i>		(1)

Question Number	Answer	Additional guidance	Mark
1(a)(iii)	The only correct answer is C three <i>A is not correct because phloem, sclerenchyma and xylem cell walls contain cellulose</i> <i>B is not correct because phloem, sclerenchyma and xylem cell walls contain cellulose</i> <i>D is not correct because the vacuole does not contain cellulose</i>		(1)

Question Number	Answer	Additional guidance	Mark
1(b)	An explanation that includes the following points: • because there are hydrogen bonds between (adjacent) cellulose molecules (1) • {layers / sheets} of microfibrils (1) • which have microfibrils at different angles (therefore it increases the strength) (1)	ignore {layers / sheets} of cellulose ACCEPT microfibrils arranged in a {criss-cross pattern / mesh}	(3)
