- (3)

[illegible]

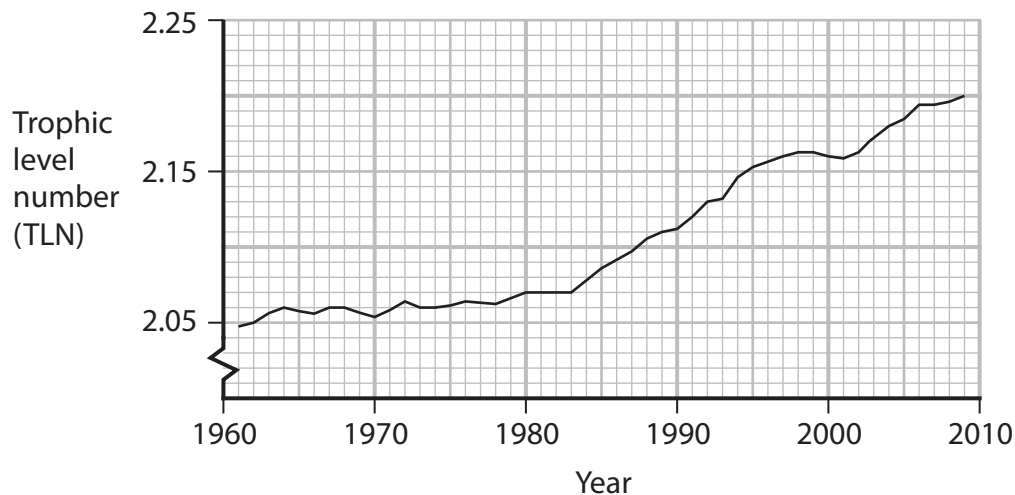

(b) Some animals eat a diet of meat and plant material.

These animals can be given a trophic level number (TLN) based on a scale of 1 to 5.

Animals that eat only plants have a TLN of 1 and animals that eat only meat and are at the top of the food chain have a TLN of 5.

Humans are an example of animals that eat both plants and animals.

The graph shows the change in the TLN for the total population of China and India from 1960 to 2010.

Explain what the information in the graph indicates about the diet of this population during this time period.
