

Question number	Answer	Mark		
3(a)	The only correct answer is B <table><tr><td>ADP is phosphorylated, requiring energy</td><td>ATP is hydrolysed, releasing energy</td></tr></table> <i>A is incorrect because energy is not released when ADP is phosphorylated</i> <i>C is incorrect because ADP is not hydrolysed in the light-dependent reactions</i> <i>D is incorrect because ADP is not hydrolysed in the light-dependent reactions</i>	ADP is phosphorylated, requiring energy	ATP is hydrolysed, releasing energy	(1)
ADP is phosphorylated, requiring energy	ATP is hydrolysed, releasing energy			

Question number	Answer	Additional guidance	Mark
3(b)(i)	An answer that includes three of the following points: • DNA (loop) (1) • stroma • starch {grain / granule} (1) • inner membrane (1) • inter membrane space • intergranal membrane / (stromal) lamellae / intergranal thylakoid (1) • (small / 70S) ribosome (1) • lipid droplets	DO NOT ACCEPT if drawn as linear DNA DO NOT ACCEPT stoma  The diagram illustrates a chloroplast with various internal components labeled. A ribosome is shown as a small dot. The intergranal membrane is depicted as a network of lines. The inner membrane forms the outer boundary. Lipid droplets are represented by small circles. The intermembrane space is the area between the inner and outer membranes. The stroma is the fluid-filled space inside the chloroplast. A circular DNA molecule is shown. A starch grain is depicted as a large, oval structure.	(3) EXP
