

- 32** The graph shows oxygen dissociation curves for three animals. The shape of each curve is influenced by respiration rate and the affinity of haemoglobin for oxygen.

What can be concluded from the graph?

- A** Animal 1 has haemoglobin adapted to have a higher affinity for oxygen than animal 2.
- B** Animal 3 has haemoglobin adapted to have a higher affinity for oxygen than animal 2.
- C** Animal 3 has haemoglobin adapted to maintain a lower respiration rate than animal 2.
- D** Animal 1 has haemoglobin adapted to maintain a higher respiration rate than animal 2.
