

9 Which properties of phospholipids explain why single layers of phospholipids added to water immediately form bilayers?

- 1 The hydrophobic fatty acid chains repel water molecules so the tails pack together.
- 2 The non-polar fatty acid chains are attracted to each other by hydrophobic interactions.
- 3 Hydrogen bonds form between the phosphate groups and water.

A 1, 2 and 3 **B** 1 and 2 only **C** 1 and 3 only **D** 2 and 3 only
