

1(a)	(nucleus of cell) D has two nucleoli v E has one nucleolus ;	1
1(b)	A = (early / mid) prophase ; R late B = (mid / late) prophase ; R early C = anaphase ;	3
1(c)	I name of stage <i>two from:</i> ref. to (daughter) chromosomes at poles ; A (sister) chromatids at poles R chromatids move to poles A two separate groups of (daughter) chromosomes A two nuclei form (enclosing chromosomes) I there are two nuclei <i>in context of at each pole</i> nuclear envelope reassembles (around chromosomes) ; A nuclear membranes reassemble nucleolus reappears / nucleoli reappear ; (daughter) chromosomes, become diffuse / become long and thin / decondense / uncoil ; A become chromatin I disappears spindle, disassembles / AW ;	2
