

Question	Marking Guidance	Mark	Comments
09.1	1. Water potential becomes lower/becomes more negative (as sugar enters phloem); 2. Water enters phloem by osmosis; 3. Increased volume (of water) causes increased pressure;	3	
09.2	1. Rate of photosynthesis related to rate of sucrose production; 2. Rate of translocation higher when sucrose concentration is higher;	2	
09.3	1. Rate of translocation does not fall to zero / translocation still occurs after 120 minutes; 2. But sucrose no longer able to enter cytoplasm of phloem cells;	2
