

| Question | Marking Guidance                                                                                                                                                                                      | Mark           | Comments                                                                                                                                                         |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01.1     | 1. Circle(s)/shape(s) drawn around H in one of the HO groups of the glycerol <b>and</b> the OH group of the fatty acid;<br>2. Ester (bond);<br>3. Condensation (reaction);                            | 3<br>(3 x AO1) | 1. Accept circle(s)/shape(s) drawn around the OH group of one molecule and the H of an OH group of the other molecule                                            |
| Question | Marking Guidance                                                                                                                                                                                      | Mark           | Comments                                                                                                                                                         |
| 01.2     | Stearic (acid);                                                                                                                                                                                       | 1<br>(1 x AO1) |                                                                                                                                                                  |
| Question | Marking Guidance                                                                                                                                                                                      | Mark           | Comments                                                                                                                                                         |
| 01.3     | As (number of C) double bonds increases, melting point decreases<br><b>OR</b><br>As unsaturation increases, melting point decreases<br><b>OR</b><br>As saturation increases, melting point increases; | 1<br>(1 x AO2) | Accept converse<br>Accept C=C for double bonds<br>Accept as (number of) hydrogen/H (atoms) increases, melting point increases                                    |
| Question | Marking Guidance                                                                                                                                                                                      | Mark           | Comments                                                                                                                                                         |
| 01.4     | 1. More unsaturated fatty acids increases fluidity (in (cell-surface membrane));<br>2. (Making cell-surface) <u>membrane</u> more fluid/flexible;<br>3. Easy to engulf;                               | 3<br>(3 x AO2) | Accept for 2 marks, more unsaturated fatty acids increases membrane fluidity<br>3. Accept endocytosis for engulf<br>3. Accept more/easier for phagosomes to form |
